elyesmahjoubi@hotmail.com | +353 (85) 123 8459 | <https://github.com/EM51641> | Swiss Citizen

Skills

Languages: Elixir, Python, TypeScript/JavaScript, Java, Nix, Rust

Backend & Data: Phoenix/LiveView, GraphQL, Postgres, Elasticsearch, Kafka, Redshift

Infra & Cloud: AWS (ECS/Fargate, EKS, Lambda, Aurora, S3, Batch, RDS), Terraform, Docker, Kubernetes

CI/CD & Observability: GitLab CI, GitHub Actions, SaltStack, Datadog, Prometheus, tempo, Grafana, OpenTelemetry

Experience

Founding Engineer, MyLift – Dublin, Ireland February 2026 – Present

- Led end-to-end development of an Elixir/Phoenix medical tourism platform connecting French-speaking patients (France, Belgium, Switzerland) with 8 verified Tunisian doctors and 5 clinics across 10+ procedures and specialties; owned architecture and product strategy
- Integrated Stripe for split payments across multiple care providers and Daily.co for real-time video consultations, enabling cross-border transactions between European patients and care providers in Tunisia
- Built role-based dashboards for doctors, clinics and patients along with an internal admin tool that powers the founding team's onboarding workflow for healthcare providers (clinics and doctors)
- Implemented direct client-to-S3 uploads via pre-signed URLs for galleries and profile images, leveraging a CDN to optimize media delivery performance

Software Engineer, Millennium – Dublin, Ireland Dec 2025 – Feb 2026

- Initiated automation of CI runner deployment using SaltStack, designed for easy rollout by adding a single configuration file to GitLab, allowing a team of 30 people to initialize individual runners
- Added change-data capture for configuration edits, giving the team an audit trail of who modified what and when on virtual machine, network and cluster configurations

Software Engineer, Gartner – Barcelona, Spain Jan 2024 – Nov 2025

- Developed a GraphQL Elixir API serving over 100 million users annually, implementing a Query Specification pattern across PostgreSQL and Elasticsearch for composable query construction and consistent pagination
- Rebuilt ad monetization interface, consolidating fragmented data sources and eliminating inconsistencies that disrupted ad delivery; this interface supports \$200M+ in annual revenue
- Accelerated Kubernetes rollouts by 25% through implementing Amazon ECR layer caching, significantly reducing container deployment times for the engineering team
- Built a query complexity framework letting backend teams validate algorithm changes pre-rollout, preventing client breakage and doubling iteration speed on a previously rarely-touched algorithm
- Built Kafka consumers across multiple Confluent topics handling 1M+ data points/day, processing both Avro and plain-format messages with schema-based deserialization where applicable

Software Developer, Amazon – Iasi, Romania May 2022 – Oct 2023

- Built a Python app querying product attributes (ASINs, etc.) on AWS Redshift, streamlining review for a 20-person team
- Created a Python application enabling a team of associates to verify item inventory within fulfillment centers (10 people)
- Developed a Python application to automate the generation of batch vendor invoices from Excel spreadsheets, reducing redundant tasks for a team of associates working on billings (5 people)

Projects

LiveDisplaced https://github.com/EM51641/livedisplaced_

- Data visualization platform built upon Python and AWS services (ECS, Batch) to track global refugee movements from the United Nations data sources

Async-sendgrid <https://pypi.org/project/sendgrid-async/>

- Developed and maintained async-sendgrid, an open-source Python client for non-blocking email delivery on SendGrid, with 400,000+ PyPI downloads

Education

HEC Lausanne – M.Sc. Finance (Quantitative), GPA: 4.9/6.0 2019 – 2021

- Thesis: Rough Volatility Modeling in option pricing (6.0/6.0)

HEC Lausanne – B.Sc. Economics, GPA: 4.6/6.0 2016 – 2019

Languages

French, Arabic (native); English (C1); Spanish (B1)
