

EDUCATION

HEC Lausanne

M.Sc. Finance (Quantitative), GPA: 4.9/6.0

Lausanne, Switzerland

2019 – 2021

- **Thesis:** Rough Volatility Modeling in option pricing (6.0/6.0)
- **Coursework:** Econometrics, Mathematics, Python/C++, Statistics

HEC Lausanne

B.Sc. Economics, GPA: 4.6/6.0

Lausanne, Switzerland

2016 – 2019

WORK EXPERIENCE

MyLift

Founding Engineer

Dublin, Ireland

February 2026 – Present

- Built a medical tourism marketplace connecting European patients with doctors in Tunisia (on Elixir). I am involved in both technical and product decisions.
- Integrated Stripe for payments and Daily.co for real-time video consultations between patients and doctors.
- Built role-based dashboards for doctors and clinics, patient-facing booking flows, and an internal admin dashboard for onboarding new doctors and clinics.
- Implemented direct client-to-S3 uploads via pre-signed URLs for doctor profile images and before/after galleries, served through a CDN.

Millennium

Software Engineer

Dublin, Ireland

December 2025 – February 2026

- I worked with Salt Stack (Configuration management tool for infrastructure) and wrote Python tooling for managing Kubernetes and Nomad clusters across thousands of nodes in trading infrastructure through capturing historical configuration data inside a configuration management database (CMDB).
- Led the initiative to automate the setup of CI runners across the entire WorldQuant-Millennium infrastructure team, allowing teams to be able to have a streamlined functional CI/CD pipeline.

Gartner

Software Engineer

Barcelona, Spain

January 2024 – November 2025

- Developed a high-performance API serving 100M+ users yearly across Capterra, Software Advice, Upcity, and GetApp. Implemented Query Specification pattern for flexible repositories and GraphQL expansions (new types/resolvers for segment-based reviews by category/industry). Designed versatile data models for RDBMS, Elasticsearch, and in-memory storage to boost scalability.
- Redesigned and rebuilt the ad monetization interface as part of an initiative to consolidate fragmented data sources and resolve system inconsistencies that previously disrupted ad delivery. This overhaul streamlined data flow, enhanced front-end reliability, and now supports over XXX million USD in annual revenue.
- Optimized AWS EKS deployments with Helm and reduced deployment times by 25% by leveraging Amazon ECR remote caching for Docker images, instead of GitHub Actions cache, enabling efficient image layer reuse.
- Spearheaded development of a global query complexity framework with customizable rulesets, enabling back-end teams to safely test algorithm changes in a pre-rollout validation environment and preventing client-side breaks through proactive failure simulation while accelerating iteration cycles by more than 100% on assessment improvements, as the complexity algorithm was only reviewed a few times a year in the past.

Amazon

Software Developer

Iasi, Romania

May 2022 – October 2023

- Built and maintained an automation that helps associates identify product attribute issues on Amazon's website by querying internal data sources. Officially credited with 2 FTEs in headcount savings.

PROJECTS

LiveDisplaced: Data visualization platform built with Quart and SQLAlchemy, integrated with AWS services to track global refugee movements

Async-sendgrid: Asynchronous Python client for Twilio SendGrid API (400K+ downloads on PyPI)

LANGUAGES

French, Arabic (native); English (C1); Spanish (B1)

SKILLS

Python, Elixir, TypeScript, JavaScript, Java, Nix • Terraform, Git, Postgres, MySQL, Elasticsearch, AWS (ECS, EKS, Lambda, ECR, IAM, R53, ACM, Batch, CF, CW, Aurora, RDS, SSM, S3, Fargate), Kafka, Docker, K8s, GitLab CI, GitHub Actions, Datadog, OpenTelemetry, Confluent, Linux
